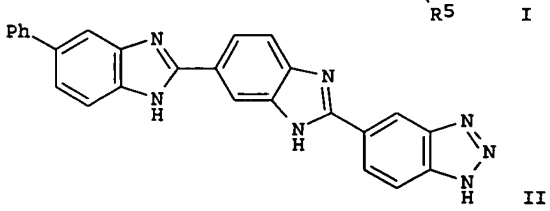
I



II

AB The invention provides title compds. I [R1, R2 = H, alkyl, cycloalkyl, alkoxy, (un)substituted (hetero)aryl, etc; or R1R2 = benzo, methylenedioxy; R3 = H, alkyl, cycloalkyl, alkoxy, OH, CF3O, halo, etc.; R4R5 = 3- to 5-atom ring-forming chain containing .gtoreq.1 NH group, and as further units O (except peroxides), S, N(X), C, or C(O), where X = null, H, O, alkyl, Ph, or PhCH2], as well as their pharmaceutically acceptable salts, pharmaceutical compns., and use of any of these to treat cancer. For instance, 5-phenyl-2-[2-(3,4-dinitrophenyl)benzimidazol-5-yl]benzimidazole was hydrogenated over Pd/C to give the 3,4-diamino compound, which underwent diazotization with concomitant cyclization to give title compound II. Two example compds. potently inhibited topoisomerase I in vitro, and also exhibited cytotoxic activity against RPMI 8402 cancer cells and camptothecin-resistant CPT-K5 cells in vitro.

ST heterocyclic topoisomerase poison benzimidazolylbenzimidazole prepn

NOVELTY - Novel bibenzimidazole derivatives are topoisomerase I inhibitors and effective cytotoxic agents against cancer cells, including drug-resistant cancer cells.
DETAILED DESCRIPTION - Bibenzimidazole derivatives of formula (I) and their salts are new.
R1, R2 = H, 1-6C alkyl, 3-6C cycloalkyl, 1-6C alkoxy, NO2, OH, 1-6C haloalkyl, OCF3, halo, 3-6C cycloalkyl-1-6C alkyl, 1-6C alkanoyl, hydroxy-1-6C alkyl, 1-6C alkoxycarbonyl, 1-6C alkylthio, 2-6C alkanoyloxy or aryl or heteroaryl (both optionally substituted by 1-3 Q); or R1 + R2 = methylene dioxy or benzo (optionally substituted by 1-3 Q);
Q = 1-6C alkyl, 3-6C cycloalkyl, 1-6C alkoxy, NO2, OH, 1-6C halo alkyl, OCF3, 3-6C cycloalkyl-1-6C alkyl, 1-6C alkanoyl, hydroxy-1-6C alkyl, 1-6C alkoxy-carbonyl, 1-6C alkylthio, 2-6C alkanoyloxy or halo;
R3 = H, 1-6C alkyl, 3-6C cycloalkyl, 1-6C alkoxy, NO2, OH, halo- 1-6C alkyl, OCF3, 3-6C cycloalkyl-1-6C alkyl, 1-6C alkanoyl, hydroxy-1-6C alkyl, 1-6C alkoxycarbonyl, 1-6C alkylthio, 2-6C alkanoyl-oxy or halo;
R4 + R5 = 3-5 membered saturated or unsaturated chain comprising non-peroxide oxygen, sulfur, N(X) and carbon, optionally substituted by oxo;
X = absent or is H, O, 1-4C alkyl, phenyl or benzyl; in which at least one (e.g.. 1 or 2) of the chain members is NH; provided that R4 + R5 are not NH-CH=N.
ACTIVITY - Cytostatic. 5-Phenyl-2'-(benzotriazol-5-yl)-bibenzimidazole showed in vitro cytotoxicity against RPMI 8402 cancer cells and camptothecin resistant CPT-K5 cells with IC50 values of 0.47 and 0.47 microns, respectively.
MECHANISM OF ACTION - Toposomerase-I Inhibitor.
USE - (I) are potent topoisomerase I poisons. They exhibit cytotoxic activity against RPMI 8402 cancer cells and camptothecin resistant CPT-K5 cells. (I) are useful as cytotoxic agents for the treatment of cancers, and in particular, solid mammalian tumors or hematological malignancies. (I) are also useful as pharmacological tools for in vitro and in vivo study of topoisomerase function and activity.

AB DNA topoisomerases play a pivotal role in the regulation of cell division. Inhibition of Leishmania spp. topoisomerases represents an alternative to control parasite growth. Cancer research led to the development of several potent topoisomerase inhibitors such as topoisomerase 1, topoisomerase 17, or both (monobenzimidazole, terbenzimidazole, and protoberberine alkaloid-related compds.) that are effective antitumor agents. In the present study, we evaluated the efficacy of these compds. against Leishmania spp. growth in vitro. Some protoberberine compds. showed pronounced antileishmanial activity and were selected for further anal. in macrophages. These compds. did not affect macrophage viability and only slightly reduced macrophage nitric oxide generation in response to interferon-.gamma.. Moreover, exposure of infected macrophages to these compds. significantly reduced parasite loads. Collectively, our data suggest that protoberberine-related compds. have powerful antileishmania action and that minor structural variations among them can substantially improve their activity to restrict Leishmania spp. infection in vitro.

AB Topoisomerase I is an enzyme that is essential for maintaining the three-dimensional structure of DNA during the processes of transcription, translation and mitosis. With the introduction of new clin. agents that

are effective in poisoning topoisomerase I, this enzyme has proved to be an attractive mol. target in the development of anticancer drugs. Several terbenzimidazoles have been identified as potent topoisomerase I poisons. Structure-activity data on various terbenzimidazoles have revealed that the presence of lipophilic substituents at the 5-position of various terbenzimidazoles correlates with enhanced cytotoxicity. While the effect of having substituents at both the 5- and 6-positions had not been evaluated, previous studies did indicate that the presence of a fused benzo-ring at the 5,6-position results in a significant decrease in topoisomerase I poisoning activity and cytotoxicity. In the present study we investigated whether substituents at both the 5- and 6-positions of varied terbenzimidazoles would allow for retention of topo I poisoning activity. The 6-bromo, 6-methoxy, or 6-Ph derivs. of both 5-bromo- and 5-phenylterbenzimidazole were synthesized and evaluated for topo I poisoning activity, as well as their cytotoxicity toward human lymphoblastoma cells. The data indicate that such derivs. do retain similar topo I poisoning activity and possess cytotoxicity equivalent to either 5-bromo- or 5-phenylterbenzimidazole. Significant enhancement in the topoisomerase I poisoning activity and cytotoxicity of 5-phenylterbenzimidazole is observed when the 2"-position is substituted with either a chloro or trifluoromethyl substituent. The influence of such substituents on the biol. activity of 5,6-dibromoterbenzimidazole (I) was also explored. In the case of either 2"-chloro-5,6-dibromoterbenzimidazole or 2"-trifluoromethyl-5,6-dibromoterbenzimidazole (II), topoisomerase I poisoning was not enhanced relative to I. While cytotoxicity toward RPMI 8402 was also not significantly affected comparative studies performed against several solid human tumor cell lines did reveal a significant increase in cytotoxicity observed for II as compared to I.

AB 5-Phenylterbenzimidazole (1) is active as a topoisomerase I poison (topo I) and is cytotoxic to human tumor cells. No cross-resistance was observed for 1 when it was evaluated against the camptothecin-resistant cell line, CPT-K5. Derivs. of 1 substituted at the 2''-position, however, did exhibit cross-resistance to this cell line. The basis for the resistance of this cell line towards CPT is that it possesses a mutant form of topo I. These results suggest that substituents at the 2''-position may be in proximity to the wild-type enzyme. Therefore, we hypothesized that terbenzimidazoles with 2''-substituents could be capable of interacting with the enzyme and thereby influence activity within this class of topo I poisons. 5-Phenylterbenzimidazoles with a hydroxy, hydroxymethyl, mercapto, amino, N-benzoylaminomethyl, chloro, and trifluoromethyl group at the 2''-position were synthesized. In addition, several 2''-ethyl-5-phenylterbenzimidazoles were prepared containing either a methoxy, hydroxy, amino, or N-acetylamino group at the 2-position of the Et side-chain. These 2''-substituted 5-phenylterbenzimidazoles were evaluated as topo I poisons and for cytotoxic activity. The presence of a strong electron-withdrawing group at the 2''-position, such as a chloro or trifluoromethyl group, did enhance both topo I poisoning activity and cytotoxicity. Studies on the relative DNA binding affinity of 1 to its 2''-amino and 2''-trifluoromethyl derivs. did exhibit a correlation with their relative differences in biol. activity.

AB A series of 2'-heterocyclic derivs. of 5-phenyl-2,5'-1H-bibenzimidazoles were evaluated for topoisomerase I poisoning activity and cytotoxicity. Topo I poisoning activity was associated with 2'-derivs. that possessed a hydrogen atom capable of hydrogen bond formation, suggesting that the interat. distances between such hydrogen atoms and the heteroatoms on the adjacent benzimidazole influence activity.

AB The invention provides title compds. I [R1, R2 = H, alkyl, cycloalkyl, alkoxy, (un)substituted (hetero)aryl, etc; or R1R2 = benzo, methylenedioxy; R3 = H, alkyl, cycloalkyl, alkoxy, OH, CF3O, halo, etc.; R4R5 = 3- to 5-atom ring-forming chain containing .gtoreq.1 NH group, and as further units O (except peroxides), S, N(X), C, or C(O), where X = null, H, O, alkyl, Ph, or PhCH2], as well as their pharmaceutically acceptable salts, pharmaceutical compns., and use of any of these to treat cancer. For instance, 5-phenyl-2-[2-(3,4-dinitrophenyl)benzimidazol-5-yl]benzimidazole was hydrogenated over Pd/C to give the 3,4-diamino compound, which underwent diazotization with concomitant cyclization to give title compound II. Two example compds. potently inhibited topoisomerase I in vitro, and also exhibited cytotoxic activity against RPMI 8402 cancer cells and camptothecin-resistant CPT-K5 cells in vitro.

I

AB The present invention provides a method of treating fungal infection with an antifungal topoisomerase I inhibitor I [Ar = aryl, heteroaryl, benzo; X = H, CN, CHO, OH, acetyl, CF3, alkoxy, NO2, NH2, halogen, haloalkyl; Y = H, alkyl, aralkyl; Y1 = H, alkyl; n = 0, 1; Z = H, alkyl, halogen, haloalkyl] or their pharmaceutically acceptable salts. Thus, I [X = Y = Y1 = Z = H; Ar = Ph, n = 1, II] was obtained from 5-benimidazolecarboxylic acid and 4-phenyl-1,2-phenylenediamine in 4 steps. II is about one half as potent as Hoechst 33342 as a topoisomerase I inhibitor.

AB 5-Substituted terbenzimidazoles were synthesized and evaluated as mammalian topoisomerase I poisons and for cytotoxicity against a human lymphoblastoma cell line, RPMI-8402. No correlation was observed between topoisomerase I poisoning activity and the Hansch .pi. value or the .sigma.meta and .sigma.para values associated with each substituent. These data suggest that electronic effects and relative lipophilicity of substituents at the 5-position of these terbenzimidazoles do not have a significant effect upon intrinsic topoisomerase I poisoning activity. A good correlation between the relative .pi. values for the various substituents evaluated and cytotoxic activity was noted. Exptl. determined log P values did not correlate well with either cytotoxicity or .pi. values. Capacity factors (log k') as determined by high pressure liquid chromatog. did correlate well with the .pi. values of varied substituents and cytotoxicity. These data indicated that the relative lipophilic activity of substituents at the 5-position of these terbenzimidazoles can strongly influence relative cytotoxic activity.

AB We have employed a broad range of spectroscopic, calorimetric, DNA cleavage, and DNA winding/unwinding measurements to characterize the DNA binding and topoisomerase I (TOP1) poisoning properties of three terbenzimidazole analogs, 5-phenylterbenzimidazole (5PTB), terbenzimidazole (TB), and 5-(naphthyl[2,3-d]imidazo-2-yl)bibenzimidazole (5NIBB), which differ with respect to the substitutions at their C5 and/or C6 positions. Our results reveal the following significant features. (I) The overall extent to which the three terbenzimidazole analogs poison human TOP1 follows the hierarchy 5PTB > TB .mchgt. 5NIBB. (Ii) The impact of the three terbenzimidazole analogs on the superhelical state of plasmid DNA depends on the [total ligand] to [base pair] ratio (rbp), having no effect on DNA superhelicity at rbp ratios .ltoreq.0.1, while weakly unwinding DNA at rbp ratios >0.1. This weak DNA unwinding activity exhibited by the three terbenzimidazoles does not appear to be correlated with the abilities of these compds. to poison TOP1. (Iii) Upon complexation with both poly(dA).cntdot.poly(dT) and salmon testes DNA, the three terbenzimidazole analogs exhibit flow linear dichroism properties characteristic of a minor groove-directed mode of binding to these host DNA duplexes. (iv) The apparent minor groove binding affinities of the three terbenzimidazole analogs for the d(GA4T4C)2 duplex follow a qual. similar hierarchy to that noted above for ligand-induced poisoning of human TOP1-namely, 5PTB > TB > 5NIBB. In the aggregate, our results suggest that DNA minor groove binding, but not DNA unwinding, is important in the poisoning of TOP1 by terbenzimidazoles.

AB The terbenzimidazoles are a class of synthetic ligands that poison the

human topoisomerase I (TOP1) enzyme and promote cancer cell death. It has been proposed that drugs of this class act as TOP1 poisons by binding to the minor groove of the DNA substrate of TOP1 and altering its structure in a manner that results in enzyme-mediated DNA cleavage. To test this hypothesis, we characterize and compare the binding properties of a 5-phenylterbenzimidazole derivative (5PTB) to the d(GA4T4C)2 duplexes. The d(GA4T4C)2 duplex contains an uninterrupted 8-bp A.cntdot.T domain, which, on the basis of x-ray crystallog. data, should induce a highly hydrated "A-tract" conformation. This duplex also exhibits anomalously slow migration in a polyacrylamide gel, a feature characteristic of a noncanonical global conformational state frequently described as "bent." By contrast, the d(GT4A4C)2 duplex contains two 4-bp A.cntdot.T tracts separated by a TpA dinucleotide step, which should induce a less hydrated "B-like" conformation. This duplex also migrates normally in a polyacrylamide gel, a feature further characteristic of a global, canonical B-form duplex. Our data reveal that, at 20.degree., 5PTB exhibits an .apprxeq.2.3 kcal/mol greater affinity for the d(GA4T4C)2 duplex than for the d(GT4A4C)2 duplex. Significantly, we find this sequence/conformational binding specificity of 5PTB to be entropic in origin, an observation consistent with a greater degree of drug binding-induced dehydration of the more solvated d(GA4T4C)2 duplex. By contrast with the differential duplex affinity exhibited by 5PTB, netropsin and 4',6-diamindino-2-phenylindole (DAPI), two AT-specific minor groove binding ligands that are inactive as human TOP1 poisons, bind to both duplexes with similar affinities. The electrophoretic behaviors of the ligand-free and ligand-bound duplexes are consistent with 5PTB-induced bending and/or unwinding of both duplexes, which, for the d(GA4T4C)2 duplex, is synergistic with the endogenous sequence-directed electrophoretic properties of the ligand-free duplex state. By contrast, the binding to either duplex of netropsin or DAPI induces little or no change in the electrophoretic mobilities of the duplexes. Our results demonstrate that the TOP1 poison 5PTB binds differentially to and alters the structures of the two duplexes, in contrast to netropsin and DAPI, which bind with similar affinities to the two duplexes and do not significantly alter their structures. These results are consistent with a mechanism for TOP1 poisoning in which drugs such as 5PTB differentially target conformationally distinct DNA sites and induce structural changes that promote enzyme-mediated DNA cleavage.

AB Terbenzimidazoles poison the nuclear enzyme topoisomerase I and possess significant cytotoxic activity against several human tumor cell lines. The relative pharmacol. activity of 4,5- and 5,6-benzoterbenzimidazoles was compared to that of 5-phenylterbenzimidazole (3). 5,6-Benzoterbenzimidazole is inactive as a topoisomerase I poison and did not exhibit significant cytotoxic activity. In contrast, 4,5-benzoterbenzimidazole retained activity as a topoisomerase I poison but exhibited weak cytotoxic activity relative to 3. While 5-(1-naphthyl)terbenzimidazole is less potent than 3 as a topoisomerase I poison and cytotoxic agent, 5-(2-naphthyl)terbenzimidazole has comparable activity to 3. The presence of a p-methoxy or p-chloro substituent on the Ph moiety did not dramatically alter the pharmacol. activity of 3. Several analogs of 3 were synthesized wherein the 2''-substituent varied from Me, Et, Pr, iso-Pr, Ph to p-methoxyphenyl. Evaluation of the intrinsic activity of these analogs as topoisomerase I poisons indicates that topoisomerase I poisoning was not diminished by the presence of a Me, Et, Pr, and iso-Pr substituent at the 2''-position. Among the various 2''-substituted analogs evaluated, only in the case of 2''-(p-methoxyphenyl)-5-phenylterbenzimidazole was a significant decrease in cytotoxicity observed

CC 7-3 (Enzymes)
Section cross-reference(s): 10
AB DNA topoisomerase I has been partially purified from Aspergillus nidulans. The purified enzyme is most likely the major nuclear DNA topoisomerase I on the basis of the following findings. (1) Purified DNA topoisomerase I can relax both pos. and neg. supercoiled DNA. (2) Neither an energy cofactor nor Mg(II) is required for the relaxation or the cleavage reaction of the enzyme. On the basis of a phosphate-transfer experiment, the Aspergillus topoisomerase I was shown to have a mol. mass (Mr) of 105 kDa. The differential sensitivity of the human and Aspergillus topoisomerase I was compared using a number of known human DNA topoisomerase I poisons. Like human DNA topoisomerase I, Aspergillus topoisomerase I is highly sensitive to the poisoning activity of camptothecin and a number of bi- and

terbenzimidazoles. However, unlike human topoisomerase I, Aspergillus topoisomerase I is completely resistant to monobenzimidazoles, protoberberines (e.g. coralyne), and nitidine. Cytotoxicity studies using yeast expressing human and yeast topoisomerase I cDNAs have also demonstrated a similar differential sensitivity of yeast topoisomerase I to these human topoisomerase I poisons. These results together suggest that the nuclear fungal topoisomerase I may be sufficiently different from its human counterpart to serve as a mol. target for the development of antifungal drugs.

AB The synthesis and pharmacol. activity of a series of terbenzimidazoles are described. The ability of these derivs. to induce DNA cleavage in the presence of topoisomerase I was evaluated in vitro. These analogs were also assayed for their cytotoxicity in RPMI cells and the camptothecin-resistant CPT-K5 cells. In addition the potential for these

compds. to serve as substrates for MDR1 was also determined Several terbenzimidazoles exhibited similar cytotoxicity against variants of human tumor cells that either overexpress MDR1 or are camptothecin-resistant. Cyclocondensation of 1,2-benzenediamine with 2,5'-bi-1H-benzimdazole-5-carboxaldehyde gave 2,5':2',5''-Ter-1H-benzimidazole.

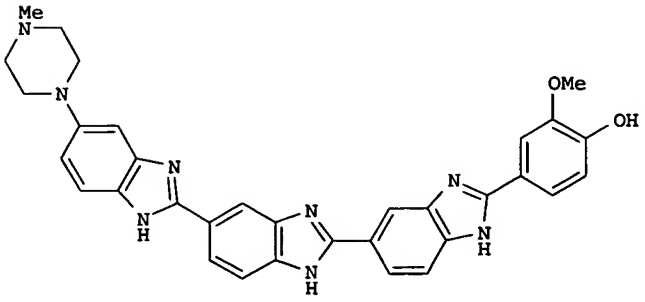
I



II

AB In a search of non-toxic and non-mutagenic DNA radioprotectors, two new disubstituted benzimidazoles I and II were synthesized. The radiomodifying effects of I and II were investigated with a human **glioma** cell line exposed to low linear energy transfer radiation by determining cell survival and cell **proliferation** compared with effects of the parent compound, Hoechst 33342. Cytotoxicity assayed by analyzing clonogenicity, cell growth, and metabolic viability showed that both I and II were non-toxic at 100 .mu.M after 72 h of exposure, whereas Hoechst 33342 resulted in lysis of 77% of these cells in 24 h. Macrocolony assay (clonogenicity) showed that 73%, 92%, and 10% of the cells survived when treated with 100 .mu.M I, II, and Hoechst 33342, resp. Both I and II did not affect the growth of BMG-1 cells. At 10 .mu.M, I

and II showed 82% and 37% protection against radiation-induced cell death (macrocolony assay) while 100% protection was observed against growth inhibition. Disubstitution of the Ph ring has not only reduced cytotoxicity but also enhanced DNA-ligand stability, conferring high degree of radioprotection.

AB The discovery of DNA topoisomerases has added a new dimension to the study of anticancer drugs. In the last years detailed investigation

of bi- and ter-benzimidazole derivs. revealed that these compds. are a new class of topoisomerase I inhibitors that poisons mammalian topoisomerase I. In this context a survey about topoisomerase I poisoning activity and cytotoxicity of bi- and ter-benzimidazoles is given. Moreover some recent results about new derivs., some structure-activity relationships and comparison of activity of various functional groups are discussed.

CC 1-3 (Pharmacology)

AB Terbenzimidazoles that inhibit topoisomerase are of interest as **anticancer** drugs. We have reviewed the literature and have developed 13 quant. structure-activity relationships (QSARs) on cleaving DNA or inhibiting the growth of **tumor** cell cultures. The results are correlated with octanol/water partition coeffs. or mol. refractivity. Suggestions have been made for the development of improved derivs.

AB The invention relates to a preparation of bisbenzimidazole derivs., e.g. I, useful as radioprotective agents. The invented compds. are DNA binding ligands (Minor Groove Binding Ligands) that afford radioprotective effect without significant mutagenicity and cytotoxic effects. Cell survival assay showed that I has 73% cell survival at 100 .mu.M concentration For instance, I was prepared via heterocyclization of 3,4-dimethoxybenzaldehyde and benzimidazole derivative II with a yield of 30% (example 10).

CC 28-9 (Heterocyclic Compounds (More Than One Hetero Atom))
AB A concise, efficient synthesis is described for a terbenzimidazole that acts as a potent topoisomerase I poison. The strategy involves iterative palladium-catalyzed borinate ester cross-couplings and should be applicable to the synthesis of analogs containing heterocycles other than benzimidazole.

AB DNA minor groove ligands provide a paradigm for double-stranded DNA recognition, where common structural motifs provide a crescent shape that matches the helix turn. Since minor groove ligands are useful in medicine, new ligands with improved binding properties based on the structural information about DNA-ligand complexes could be useful in developing new drugs. Here, two new synthetic analogs of AT specific Hoechst 33258 5-(4-methylpiperazin-1-yl)-2-[2'-(3,4-dimethoxyphenyl)-5'-benzimidazolyl] benzimidazole (DMA) and 5-(4-methylpiperazin-1-yl)-2-[2'{2''-(4-hydroxy-3-methoxyphenyl)-5''-benzimidazolyl}-5'-benzimidazolyl] benzimidazole (TBZ) were evaluated for their DNA binding properties. Both analogs are substituted on the Ph ring. DMA contains two ortho positioned methoxy groups, and TBZ contains a phenolic group at C-4 and a methoxy group at C-3. Fluorescence yield upon DNA binding increased 100-fold for TBZ and 16-fold for DMA. Like the parent compound, the new ligands showed low affinity to GC-rich (K .apprxeq. 4 .times. 107 M-1) relative to AT-rich sequences (K .apprxeq. 5 .times. 108 M-1), and fluorescence lifetime and anisotropy studies suggest two distinct DNA-ligand complexes. Binding studies indicate expanded sequence recognition for TBZ (8-10 AT base pairs) and tighter binding (.DELTA.Tm of 23 .degree.C for d (GA5T5C)). Finally, EMSA and equilibrium binding titration studies indicate that TBZ preferentially binds highly hydrated duplex domains with altered A-tract conformations d (GA4T4C)2 (K = 3.55 .times. 109 M-1) and alters its structure over d (GT4A4C)2 (K = 3.3 .times. 108 M-1) sequences. Altered DNA structure and higher fluorescence output for the bound fluorophore are consistent with adaptive binding and a constrained final complex. Therefore, the new ligands provide increased sequence and structure selective recognition and enhanced fluorescence upon minor groove binding, features that can be useful for further development as probes for chromatin structure stability.

AB Two tris-benzimidazole derivs. have been designed and synthesized based on the known structures of the bis-benzimidazole stain Hoechst 33258 complexed to short oligonucleotide duplexes derived from single crystal x-ray studies and from NMR. In both derivs. the phenol group has been replaced by a methoxy-Ph substituent. Whereas one tris-benzimidazole carries a N-methyl-piperazine at the 6-position, the other one has this group replaced by a 2-amino-pyrrolidine ring. This latter substituent

results in stronger DNA binding. The optimized synthesis of the drugs is described. The two tris-benzimidazoles exhibit high AT-base pair (bp) selectivity evident in footprinting expts. which show that five to six base pairs are protected by the tris-benzimidazoles as compared to four to five protected by the bis-benzimidazoles. The tris-benzimidazoles bind well to sequences like 5'-TAAAC, 5'-TTTAC and 5'-TTTAT, but it is also evident that they can bind weakly to sequences such as 5'-TATGTT-3' where the continuity of an AT stretch is interrupted by a single G.cntdot.C base pair.

AB A procedure was developed for quant. estimation of the ligand affinity for the DNA minor groove with allowance for ligand hydration, whereby the binding energy was calculated as the difference in the energies of ligand-DNA and ligand-water interactions. Adequacy of the procedure was demonstrated with the structural motifs (pyrrolecarboxamide, benzimidazole, furancarboxamide, and phthalimide) of well-known ligands for the case of a d(GCA10CG).cntdot.d(CGT10GC) duplex. On the strength of the results

obtained, an indole-based motif was proposed as the basis for a highly affined minor groove binder.

AB A series of three-ring analogs of the minor-groove-binding mol. Hoechst 33258 (1), consisting of benzimidazole (B), imidazopyridine (P), and hydroxybenzimidazole (H) monomers, have been synthesized in order to

investigate both their sequence specificity and binding modes. MPE.cntdot.FeII Footprinting has revealed the preference of both PBB and BBB ligands for 5'-WGWWW-3' and 5'-WCWWW-3' tracts, as well as A.cntdot.T-rich sequences. Affinity-cleavage titrns. show no evidence for a 2:1 binding mode of these Hoechst analogs. Importantly, all derivs. are oriented in one direction at each of their binding sites. The implications of these results for the design of minor-groove-binding small mols. is discussed.

AB Benzimidazole compds. have been synthesized to study their DNA-binding properties. Results obtained with spectroscopy and viscosity measurements indicate that the binding mode varies from intercalation to groove-binding, depending on the number of benzimidazole rings (conformation and size of compds.).

AB The crystal structure of the non-self-complementary dodecamer DNA duplex formed by d(CG[5BrC]ATATTTGCG) and d(CGCAAATATGCG) has been solved to 2.3 .ANG. resolution, together with that of its complex with the tris-benzimidazole minor groove binding ligand TRIBIZ. The inclusion of a bromine atom on one strand in each structure enabled the possibility of disorder to be discounted. The native structure has an exceptional narrow minor groove, of 2.5-2.6 .ANG. in the central part of the A/T region, which is increased in width by .apprx.0.8 .ANG. on drug binding. The ligand mol. binds in the central part of the sequence. The benzimidazole subunits of the ligand participate in six bifurcated hydrogen bonds with A:T base pair edges, three to each DNA strand. The presence of a pair of C-H...O hydrogen bonds has been deduced from the close proximity of the pyrrolidine group of the ligand to the TpA step in the sequence.

CC 1-3 (Pharmacology)

AB In contrast to rational drug and ligand design based on mol. graphics for the field of proteins, the situation for nucleic acid ligand design is less advanced, but is now proceeding rapidly. For DNA the aspect most developed in this sense is the minor groove, but for RNA there is still rather little in the way of ligand design reported. Insight into the DNA minor groove has reached the stage at which it is now possible to test the

possibility of rational ligand design in a number of objective ways. The first stage of this is to rationalize observations already made, but more rigorous is to test the ability to predict structural and chemical properties. In this contribution the ability to predict binding interactions for ligands in the minor groove of B-DNA of a series of analogs of Hoechst 33258 will be analyzed. These compds. were designed using mol. graphic/dynamics based on high-field NMR structural determination of Hoechst-duplex DNA complexes using a synthetic oligonucleotide sequence. Enthalpy and entropy contributors to net binding strength will be considered. The test of prediction powers is not merely to be able to achieve better net ligand binding strength, but also to propose specific bonding interactions. These predictions have been probed structurally using NMR anal. at high resolution of ligand-DNA complexes, again designed by mol. modeling. As well as using structural probes such as NMR spectroscopy, it is possible to test predictive ability by introducing novel chemical reactivity. In this context we shall describe a novel DNA strand-cleaving method, designed using mol. graphics of the above structures to locate a transition metal ion binding site very specifically and close to the phosphodiester backbone, allowing the generation of reactive free radicals to effect cleavage. Relative to DNA, RNA-binding ligands are less widely studied at present and, in the final part of the contribution, the binding properties of some new ligands for tRNA, binding with 1:1 stoichiometry and low micromolar dissociation consts. will be described. Their binding has been studied by UV-visible spectrophotometry, fluorescent titration and NMR spectroscopy.

AB The authors report new quant. footprinting data which reveal differences in binding consts. of bisquaternary ammonium heterocyclic compds. (BQA) with AT-rich DNA sites depending on the ligand structure and on the size and sequence of the DNA binding site. To understand the dependence of binding affinity on the ligand structure the authors have performed quantum-chemical AM1 calcns. on the BQA compds. and on subunits to explore the conformational space and to calculate the electronic and structural features of individual ligand conformations. Due to the properties of the rotatable backbone bonds, there is a large number of possible conformations with almost equal energy. The authors present a new method for the calcn. of the radius of curvature of mol. structures. Assuming that strong binders should have a shape complementary to the DNA minor groove, this measure is used to select the optimum conformations for DNA-drug binding. The approach yields the correct ligand conformation for SN6999, for which an x-ray DNA-drug structure is known. The curvature of the optimum conformations of all ligands is compared with the exptl. binding consts. A correlation is found between curvature and binding constant provided other structural factors do not vary. Therefore, the authors conclude that within structurally similar BQA compds., the extent of curvature is the relevant quantity which modulates the binding affinity.

AB The crystal structure is reported of a tris(benzimidazole) analog of the minor-groove drug Hoechst 33258 bound to the sequence d(CGCAAATTTGCG)2. The structure has been refined to an R factor of 17.4% at a resolution of 2.2 .ANG.. The ligand covers .apprx.71/2 base pairs, including the 5'-AAATTT central sequence. This has an exceptionally narrow minor-groove width, together with high propeller twists for individual base pairs. The ligand has a highly twisted structure, with an overall twist of 50.degree. between aromatic rings. All three benzimidazole subunits are in register with the DNA, and there is a sym. group of six hydrogen bonds between ligand and A.cntdot.T base-pair edges. By contrast, the ligand does not show an optimal isohelical fit to the DNA. The correct phasing of drug and DNA base pairs is ensured by a number of changes to the DNA such that the central 5'-AAATTT region is slightly unwound relative to the structures of other noncovalent minor-groove drug complexes.

By similar methods, 50 g. 6-chloro-3-nitro-4-acetamidotoluene and 30 g. 1-methylpiperazine gave 44 g. 4-methyl-5-(1-methyl-4-piperazinyl)-2-nitroacetanilide, m. 166.degree., hydrolysis of which gave 4-methyl-5-(1-methyl-4-piperazinyl)-2-nitroaniline (VI), m. 208.degree.. VI and IIa gave 2-(3-nitro-4-aminophenyl)-5-methyl-6-(1-methyl-4-piperazinyl)benzimidazole, m. 280.degree., which was hydrogenated to give 2-(3,4-diaminophenyl)-5-methyl-6-(1-methyl-4-piperazinyl) benzimidazole (VII), m. 155.degree.. VII (11.3 g.) and 8 g. 4-methoxybenzimino ether hydrochloride in 80 ml. HOAc gave 10.3 g. 2-[2-(4-methoxyphenyl)-6-benzimidazolyl]-5-methyl-6-(1-methyl-4-piperazinyl)benzimidazole (I, Ar = 4-MeOC6H4, R1 = R2 = Me) sesquihydrate; anhydride m. 196.degree.. Compds. prepared in similar sequences were: 4-chloro-5-(1-methyl-4-piperazinyl)-2-nitroacetanilide, m. 150.degree., 4-chloro-5-(1-methyl-4-piperazinyl)-2-nitroaniline, m. 202.degree., 4-chloro-5-(1-methyl-4-piperazinyl)-1,2-diaminobenzene, 2-(3-nitro-4-aminophenyl)-5-chloro-6-(1-methyl-4-piperazinyl)benzimidazole, m. 258.degree., and 2-[2-(4-methoxyphenyl)-6-benzimidazolyl]-5-chloro-6-(1-methyl-4-piperazinyl)benzimidazole (I, Ar = 4-MeOC6H4, r1 = Me, R2 = Cl) tetrahydrate; anhydride m. 207.degree.; 5-(1-ethyl-4-piperazinyl)-2-nitroacetanilide, m. 102.degree., 5-(1-ethyl-4-piperzinyl)-2-nitroaniline, m. 125.degree., 5-(1-ethyl-4-piperazinyl)-1,2-diaminobenzene, 2-(3-nitro-4-aminophenyl)-6-(1-ethyl-4-piperazinyl)benzimidazole, m. 188.degree., 2-(3,4-diaminophenyl)-6-(1-methyl-4-piperazinyl)benzimidazole, m. 170.degree., and 2-[2-(4-methoxyphenyl)-6-benzimidazolyl]-6-(1-ethyl-4-piperazinyl)benzimidazole, m. 188.degree. (monohydrate); 5-(1-isopropyl-4-piperazinyl)-2-nitroacetanilide, m. 87.degree., 5-(1-isopropyl-4-piperazinyl)-2-nitroaniline, m. 127.degree., 5-(1-isopropyl-4-piperazinyl)-1,2-diaminobenzene, m. 131.degree.,

2-(3-nitro-4-aminophenyl)-6-(1-isopropyl-4-piperazinyl)benzimidazole, m. 199.degree., 2-(3,4-diaminophenyl)-6-(1-isopropyl-4-piperazinyl)benzimidazole, m. 284.degree., and 2-[2-(4-methoxyphenyl)-6-benzimidazolyl]-6-(1-isopropyl-4-piperazinyl)benzimidazole, m. 214.degree. (dihydrate-hemiisopropylate); 5-(1-butyl-4-piperazinyl)-2-nitroacetanilide, m. 89.degree., 5-(1-butyl-4-piperazinyl)-2-nitroaniline, m. 110.degree., 5-(1-butyl-4-piperazinyl)-1,2-diaminobenzene, 2-(3-nitro-4-aminophenyl)-6-(1-butyl-4-piperazinyl)benzimidazole, m. 170.degree., 2-(3,4-diaminophenyl)-6-(1-butyl-4-piperazinyl)benzimidazole, m. 267.degree., and 2-[2-(4-methoxyphenyl)-6-benzimidazolyl]-6-(1-butyl-4-piperazinyl)benzimidazole, m. 260.degree. (sesquihydrate); 5-(1-benzyl-4-piperazinyl)-2-nitroacetanilide, m. 136.degree.; 5-(1-benzyl-4-piperazinyl)-2-nitroaniline, m. 162.degree., 5-(1-benzyl-4-piperazinyl)-1,2-diaminobenzene, 2-(3-nitro-4-aminophenyl)-6-(1-benzyl-4-piperazinyl)benzimidazole, m. 170.degree., 2-(3,4-diaminophenyl)-6-(1-benzyl-4-piperazinyl)benzimidazole, m, 206.degree., and 2-[2-(4-methoxyphenyl)-6-benzimidazolyl]-6-(1-benzyl-4-piperazinyl)-benzimadazole, m. 169.degree. (hemihydrate); 2-[2-(4-methoxyphenyl)-6-benzimidazolyl]-6-(4-piperazinyl)benzimidazole (by hydrogenolysis of the preceeding compound), m. 267.degree. (3.5H2O); 5-[1-(2-hydroxyethyl)-4-piperazinyl]-2-nitroacetanilide, m. 157.degree., 5-[1-(2-hydroxyethyl)-4-piperazinyl]-2-nitroaniline, m. 160.degree., 5-[1-(2-hydroxyethyl)-4-piperazinyl]-1,2-diaminobenzene, 2-(3-nitro-4-aminophenyl)-6-[1-(2-hydroxyethyl)-4-piperazinyl]benzimidazole, m. 120.degree., 2-(3,4-diaminophenyl)-6-[1-(2-hydroxyethyl)-4-piperazinyl]benzimidazole, m. 200.degree.; and 2-[2-(4-methoxyphenyl)-6-benzimidazolyl]-6-[1-(2-hydroxyethyl)-4-piperazinyl]benzimidazole, m. 190.degree. (sesquihydrate); 5-(1-ethoxycarbony Hydrogenation of 28 g. Ib in 400 ml. MeOH on Ni gave 18 g. 2-[2-(4-aminophenyl)-6-benzimidazolyl]-6-(1-methyl-4-piperazinyl)benzimidazole, m. 230.degree. (sesquihydrate). I have anthelminthic activity.

AB 3-(2-Aminoethyl)-1H-1,2,4-triazole (I) and several of its derivs. have been synthesized. I and, to a lesser degree, its 3-PhCH2NHCH2CH2 (II), 3-Me2CHNHCH2CH2 (III), and 3-AcNHCH2CH2 analogs (IV) exhibited a typical histaminelike activity and were effective orally. H2NCSNHNH2 (102 g.) and 700 cc. dry pyridine treated during 1-2 h. portion-wise with 237 g. .omicron.-C6H4(CO)2NCH2CH2COCl below 0.degree., the mixture let stand overnight, poured with stirring into 2 l. ice water, and the heavy white precipitate washed with 1 l. ice water, 1 l. 50% aqueous AcOH, and again 1 l. ice water yielded 235-50 g. (80-5%) .omicron.-C6H4(CO)2NHCH2CH2CONHNHCSNH2 (V), white needles, m. 238-9.degree. (decomposition) (from AcOH). V (292 g.), 60 g. NaOMe, and 2.5 l. absolute EtOH refluxed overnight, about 2 l. solvent evaporated in vacuo, the residue added with stirring to 2 l. ice water containing 125 cc. concentrated HCl, the mixture let stand, and the solid product washed with 500 cc. H2O, 200 cc. 50% aqueous AcOH, and 200 cc. glacial AcOH gave 140 g. (50%) 3-(2-phthalimidoethyl)-1H-1,2,4-triazole-5-thiol (VI), white needles, m. 295-7.degree. (from AcOH). VI (13.7 g.) suspended in 50 cc. H2O and treated with 10 cc. N2H4.H2O, the mixture let stand overnight at room temperature, and the resulting solid recrystd. from 200 cc. hot H2O yielded 4.5 g. (61%) 3-(2-aminoethyl)-1H-1,2,4-triazole-5-thiol, needles, m. 296-8.degree. (decomposition); the base dissolved in dilute HCl and the solution concentrated to dryness in vacuo gave the HCl salt, needles, m. 270.degree. (precipitated from MeOH with Et2O). VI (27.4 g.), 5.4 g. NaOMe, and 6.2 cc. MeI in 200 cc. EtOH refluxed 2 h., the solvent evaporated in vacuo, the residue extracted with 150 cc. hot EtOH, and the extract cooled deposited 20 g. 3-(2-phthalimidoethyl)-5-methylthio-1H-1,2,4-triazole (VII), dendritic crystals, m. 170-2.degree. (from H2O). VII (5.8 g.) and 3 cc. N2H4.H2O in 50 cc. H2O let stand overnight at room temperature, the mixture evaporated in vacuo,

the residue extracted with 100 cc. hot C6H6, the extract evaporated, the residue dissolved in EtOH, and the solution treated with dry HCl gave 3.2 g. (70%) di-HCl salt (VIII) of 3-(2-aminoethyl)-5-methylthio-1H-1,2,4-triazole, m. 218.degree. (decomposition) (from MeOH-Et2O). VII (5.8)and 50 cc. 6N HCl refluxed 6 h., the mixture cooled, filtered, and the filtrate evaporated in vacuo gave 76% VIII. VI (2.7 g.) in 100 cc. 10% aqueous AcOH treated 1 h. below 10.degree. with stirring with dry Cl, the resulting white solid filtered off, added directly to 100 cc. concentrated NH4OH, the solution evaporated on a steam bath overnight, the solid residue slurried with 50 cc. N HCl, and the product recrystd. from H2O gave 1.3 g. (40%) 3-(2-phthalimidoethyl)-1H-1,2,4-triazole-5-sulfonamide (IX), m. 280-2.degree. (decomposition). IX (3.2 g.), 3 cc. N2H4.H2O, and 50 cc. MeOH refluxed 0.5 h., the solvent removed in vacuo, the residue dissolved in 50 cc. H2O, the solution treated with 6N HCl, the precipitated phthalhydrazide filtered off, the filtrate evaporated to dryness, the residue treated with 50 cc. N NaOH, again taken to dryness in vacuo, and treated with 50 cc. 6N HCl, the solution evaporated to dryness, the residue extracted with EtOH, and the extract diluted with Et2O gave 3-(2-aminoethyl)-1H-1,2,4-triazole-5-sulfonamide-HCl, irregular white prisms, m. 170.degree. (decomposition), also obtained by the hydrolysis of IX with 6N HCl. To 100 cc. concentrated HNO3, 200 cc. H2O, and 1 g. NaNO2 was added below 45.degree. with stirring 100 g. VI in small portions, the mixture cooled to 0.degree., cautiously neutralized with saturated aqueous Na2CO3, and the precipitate washed with H2O to give 40 g. (43%) 3-(2-phthalimidoethyl)-1H-1,2,4-triazole (X), needles, m. 215.degree. (from H2O); HCl salt, m. 245.degree. (from MeOH-Et2O). VI dissolved in dilute aqueous NaOH, the solution acidified, and the product oxidized similarly with HNO3 gave no X. VI (1 g.) 3 teaspoonfuls Raney Ni, and 200 cc. EtOH refluxed 4 h., the hot mixture filtered, and the filtrate evaporated to dryness in vacuo gave X, white needles, m. 214-15.degree.. X (40 g.) and 500 cc. 6N HCl refluxed 8 h., the mixture cooled several hrs., filtered, the filtrate evaporated to dryness in vacuo, the residue dissolved in 500 cc. MeOH, and the solution treated with C and diluted with 1 l. Et2O gave 25-30 g. (84-97%) I.2HCl, decomposed at 251.degree.. I.2HCl (18.5 g.) in 100 cc. absolute EtOH refluxed 1 h. with 10.8 g. NaOMe, the mixture filtered, and the filtrate distilled gave 9 g. (80%) I, b0.1 158-60.degree., m. 83-5.degree.; dipicrate, yellow cubes, m. 190.degree. (from EtOH). I (11.2 g.), and 5.1 g. Me2CO in 100 cc. EtOH hydrogenated 6 h. over 0.1 g. PtO2 while heated with an IR lamp, the mixture filtered, the filtrate evaporated in vacuo, the residue in 50 cc. EtOH added to 46 g. picric acid in 300 cc. 95% EtOH, the solution cooled, and the solid deposit recrystd. twice from 300-cc. portions of 95% EtOH gave 45 g. (72%) dipicrate of III, m. 142-4.degree.; the dipicrate suspended in 200 cc. PhNO2, the mixture extracted with three 100-cc. portions of concentrated HCl, the extract washed with CHCl3, evaporated in vacuo, and the residue dissolved in MeOH and precipitated with Et2O gave III.2HCl, m. 186.degree.. I (3.4 g.) and 3.2 g. freshly distilled BzH in 50 cc. EtOH refluxed 2 h., the mixture hydrogenated over PtO2 at 40 lb. pressure, filtered, and the filtrate treated with 13.8 g. picric acid in 100 cc. hot EtOH gave 70% dipicrate of II, m. 115-17.degree. (from 50% aqueous EtOH), converted to II.2HCl, m. 220.degree.. I.2HCl (5.6 g.), 2.4 g. KOCN, and 2.5 g. NaHCO3 in 100 cc. H2O evaporated on the steam bath, the residue extracted with 50 cc. EtOH, and the extract diluted with 500 cc. Et2O gave 3-(2-ureidoethyl)-1H-1,2,4-triazole, m. 188-90.degree.. I.2HCl (5.5 g.) in 100 cc. 2N NaOH treated with stirring at 0.degree. with 2.8 g. BzCl, the mixture treated after 2 h. with 25 g. ice, adjusted with concentrated HCl to pH 5, and the precipitate washed with aqueous NaHCO3 and recrystd. from H2O gave 3.8 g. (55%) 3-(2-benzamidoethyl)-1H-1,2,4-triazole, feathery plates, m. 189-90.degree.. I.2HCl (5.5 g.) in 50 cc. 2N NaOH treated at 0.degree. with 2 cc. AcOH, the solution after 0.5 h. acidified with 6N HCl, evaporated to dryness, the residue extracted with 100 cc. warm absolute EtOH, and the extract diluted with 400 cc. Et2O gave IV.HCl, white solid, m. 160.degree.. I (1.7 g.) and 2 g. Ac2O in 50 cc. glacial AcOH heated 3 h. on the steam bath, the mixture diluted with 25 cc. H2O, let stand 15 min., concentrated to dryness in vacuo, the residue recrystd. from EtOH gave IV, needles, m. 215-16.degree..

AB cf. ibid. 697. To 1.32 g. 5-methylbenzimidazole in 10 ml. 1:3 H2SO4 was added dropwise at 100-3.degree. 2.4 g. chromic acid in 10 ml. H2SO4 (1:3) and the mixture chilled after 15 min., yielding 5-benzimidazolecarboxylic acid sulfate, which with NaOAc gave the free acid, m. 300-25.degree. (from H2O). This (1.62 g.) and 1.08 g. .omicron.-C6H4(NH2)2 in 10 ml. 20% HCl heated in sealed tube 4 hrs. at 180-200.degree., then neutralized with NH4OH and filtered, gave 5-(2'-benzimidazolyl)benzimidazole, isolated as the di-HCl salt, m. 362.degree. (from concentrated HCl); the free base could not be purified owing to the formation of gels. Similar oxidation of 2,5-dimethylbenzimidazole gave 70-5% 2-methyl-5-benzimidazolecarboxylic acid (I), m. 301-2.degree. (from H2O). This with .omicron.-C6H4(NH2)2 in 20% HCl as above gave after 40 min. at 180-200.degree. 2-methyl-5-(2'-benzimidazolyl)benzimidazole-2HCl, m. 339-40.degree. (from HCl), which with NH4OH gave the free base (II), m. 340.degree. (from dilute EtOH); this with NH4OH-AgNO3 in EtOH gave a flocculent di-Ag salt; the free base yields a dipicrate, m. 282-2.5.degree.. 3,4-(H2N)2C6H3Me (1.22 g.) and 1.76 g. I in 10 ml. 20% HCl heated in a sealed tube 4 hrs. at 180-200.degree. gave 2,5'-dimethyl-5-(2'-benzimidazolyl)benzimidazole, m. high and unsharp, which gave a di-HCl salt, m. above 360.degree. (from 25% HCl); the free base yields a picrate, m. 274.degree.. This oxidized with chromic acid as above gave 2-methyl-5-(5'-carboxy-2'-benzimidazolyl)benzimidazole-2HCl (III), m. about 350.degree. (from 15% HCl); this, decarboxylated by heating with sodalime at 300.degree. gave II (picrate, m. 274.degree.). III with .omicron.-C6H4(NH2)2 and 15% HCl 4 hrs. at 180-200.degree. gave 75% 2-methyl-5-[2'-benzimidazolyl-5'-(2''-benzimidazolyl)]benzimidazole-3HCl, m. above 360.degree. (from dilute HCl). Similarly condensation with 3,4-(H2N)2C6H3Me gave 85-90% 2,5'-dimethyl-5-[2'-benzimidazolyl-5'-(2''-benzimidazolyl)]benzimidazole-3HCl, m. about 400.degree. (from dilute HCl). 2-Phenyl-5-methylbenzimidazole with chromic acid in aqueous H2SO4 gave 2-phenyl-5-benzimidazolecarboxylic acid, isolated as the HCl salt, m. 304-5.degree. (from aqueous HCl). Electrometric titration of this gives 2 pH breaks; at 8.4 and a weak one whose position is unstated. This heated with .omicron.-C6H4(NH2)2 in 15% HCl in sealed tube 6 hrs. at 180-200.degree. gave 2-phenyl-5-(2'-benzimidazolyl)benzimidazole, m. 308-10.degree. (from dilute EtOH); HCl salt, m. 323-6.degree. (from dilute HCl). Similarly 3,4-(H2N)2C6H3Me gave 2-phenyl-5-(5'-methyl-2'-benzimidazolyl)benzimidazole, m. 329-31.degree. (from dilute EtOH); HCl salt, m. 311-15.degree. (from dilute HCl). This was oxidized as above to 2-phenyl-5-(5'-carboxy-2'-benzimidazolyl)benzimidazole, isolated as the HCl salt, m. 314-19.degree., which, heated with .omicron.-C6H4(NH2)2 and 10% HCl, gave 2-phenyl-5-[2'-benzimidazolyl-5'(2''-benzimidazolyl)]benzimidazole, isolated as the di-HCl salt, does not m. 360.degree. (from aqueous HCl). 3,4-(H2N)2C6H3Me gave 2-phenyl-5-[2'-benzimidazolyl-5'(5''-methyl-2''-benzimidazolyl)]benzimidazole, isolated as the di-HCl salt, does not m. 360.degree.; the free base is insol. in organic solvents except AcOH in which it forms the corresponding salt. Heating 2.25 g. 3,4-(H2N)2C6H3CO2H.HCl with .omicron.-C6H4(NH2)2 and 10 ml. 20% HCl in a sealed tube 40 min. at 180-200.degree. gave 0.1 g. 3,4-diaminophenylbenzimidazole, m. 325-30.degree. (from 10% HCl); this reacts with HNO2 without forming a diazonium salt; in AcOH it gives a green precipitate with phenanthrenequinone. Condensation with HCO2H or AcOH gave the previously described bis-benzimidazole derivs. (cf. C.A. 44, 1100b). Benzimidazoles have characteristic absorption maximum at 2700-800, dibenzimidazoles at 3100-200, and tribenzimidazoles at 3400-500 A.; even the latter absorb but weakly in the visible, being pale yellow.
